I build tools at NVIDIA that predict GPU power, plus side projects of my own: a small studio (Lokasu) and products for Vilje Tech.

Experience

2024–now **NVIDIA** ASIC Engineer, Power Architecture Analysis

- Rewrote the team's GPU power model from scratch in TypeScript: one run went from 1 min 55 s to 60 µs. The team's Python notebooks run the same engine.
- Built PACE (Power Architecture Chat Engine), a chatbot that answers questions from the team's docs; it also showed which pages were out of date. PACE won NTech 2025, NVIDIA's internal paper contest.
- Mentor the team's interns.

2024–now **Outside NVIDIA** Lokasu, Vilje Tech, freelance

- Freelance edge AI: vision models running on small Intel PCs for shops (ONNX, OpenVINO).
- Lokasu, my weekend studio: designed and coded lokasu.com (a Three.js home page) and Launch Check, a free link checker.
- Since 2026, ViljePDF, ViljeCAD and Inwoice for Vilje Tech, an AI and automation company in Helsingborg, Sweden.

2022 **MRM Procom & Testright** Internships

- MRM Procom: an Android app to control their smart devices, with 100% Espresso test coverage.
- Testright: a camera module for checking diamonds that cut weeks off their R&D.

Education

2020–24 **NIT Andhra Pradesh** B.Tech, Computer Science, minor in AI for Signal Processing

- DSA lab teaching assistant; started CS007, a coding course for juniors; Economic Times Campus Star.

Publication and open source

2026 **Assessment of the Knowledge-Infused Policy Gradient Approach for StarCraft** Springer, ICT for Intelligent Systems

- My final-year project, written with K. Seshadri and V.K. Andraju. doi.org/10.1007/978-981-95-1357-4_9

2024 **Continue** merged PR #2233

- Added NVIDIA NIM as an embeddings provider to Continue, the open-source AI coding assistant.

2024 **d3-hwschematic** fork of Michal Orsák's library

- Reworked how it draws nodes and wires in interactive hardware schematics (D3, ELK).

Skills

TypeScript, Python, Svelte, SQL, C/C++, Java; RAG and agents; ONNX and OpenVINO; Linux, Docker, Git
